

Angular Authorization Login Business Logic

REST API for retrieving bearer token (POST Login API)

1. Store this `access_token` & `refresh_token` in local storage/cookie after encoding using **btoa** method
2. Now after login, this `access_token` will be passed with other API's request body to fetch data

Note: Response JSON is a sample response. It can be different for different application.

Refresh token

To understand refresh token & access token please read the article

<https://cloud.google.com/docs/authentication/token-types>
