

Tips for Responsive Design in CSS

Padding/Margin

We usually use a lot of padding when we make websites for desktops to make them more attractive.

While making it responsive for mobiles tablets try decreasing the existing padding's and margins.

Use Em/Rem

Always try using em/percentage /rem instead of px, so that the text, images size adjust with respect to the device width.

Media Query

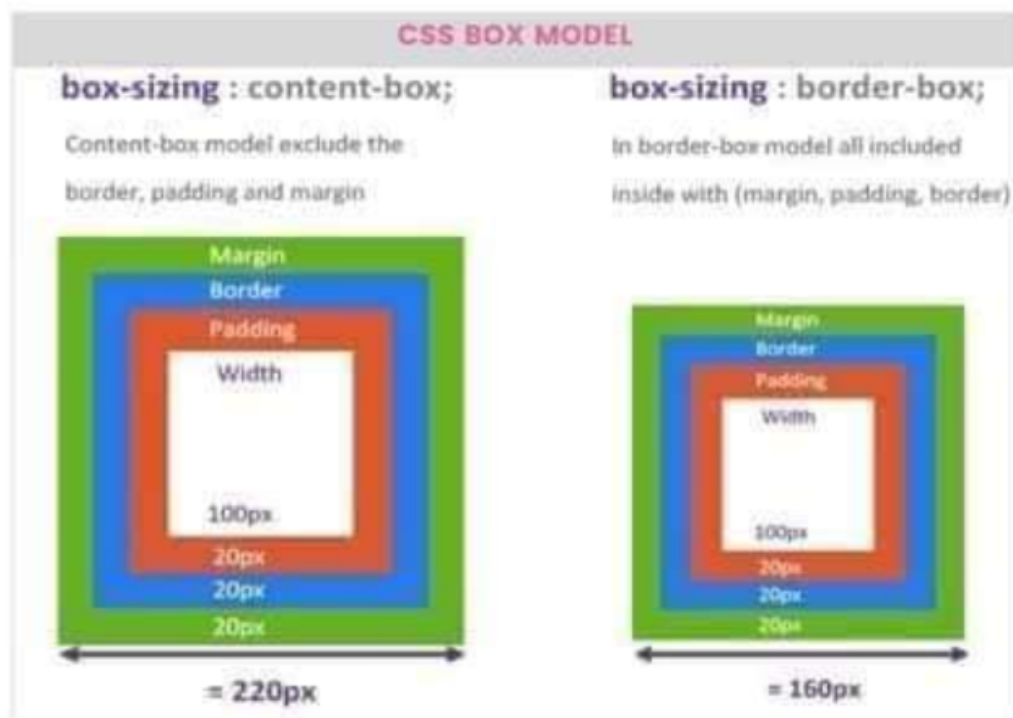

Media query should be used to set width and height according to the breakpoints. Breakpoint refers to the width at which the website starts looking distorted.

Flex Wrap

Using flexbox to align your HTML elements such as `<div><p>` provides the force elements that can wrap onto multiple lines according to their width.

Box-Sizing

It resolves a lot of problems padding causes, using box-sizing on HTML elements with a percentage width will take padding into account rather than having to adjust the width due to padding.

```
{ box-sizing : border box; }
```
