

# Agenda

## Angular Interview Q&A

- Angular History
- Single Page App (SPA)
- Angular CLI
- Angular Configuration
- Angular Building Blocks
- Components and Decorators

Q&A:

# Angular History

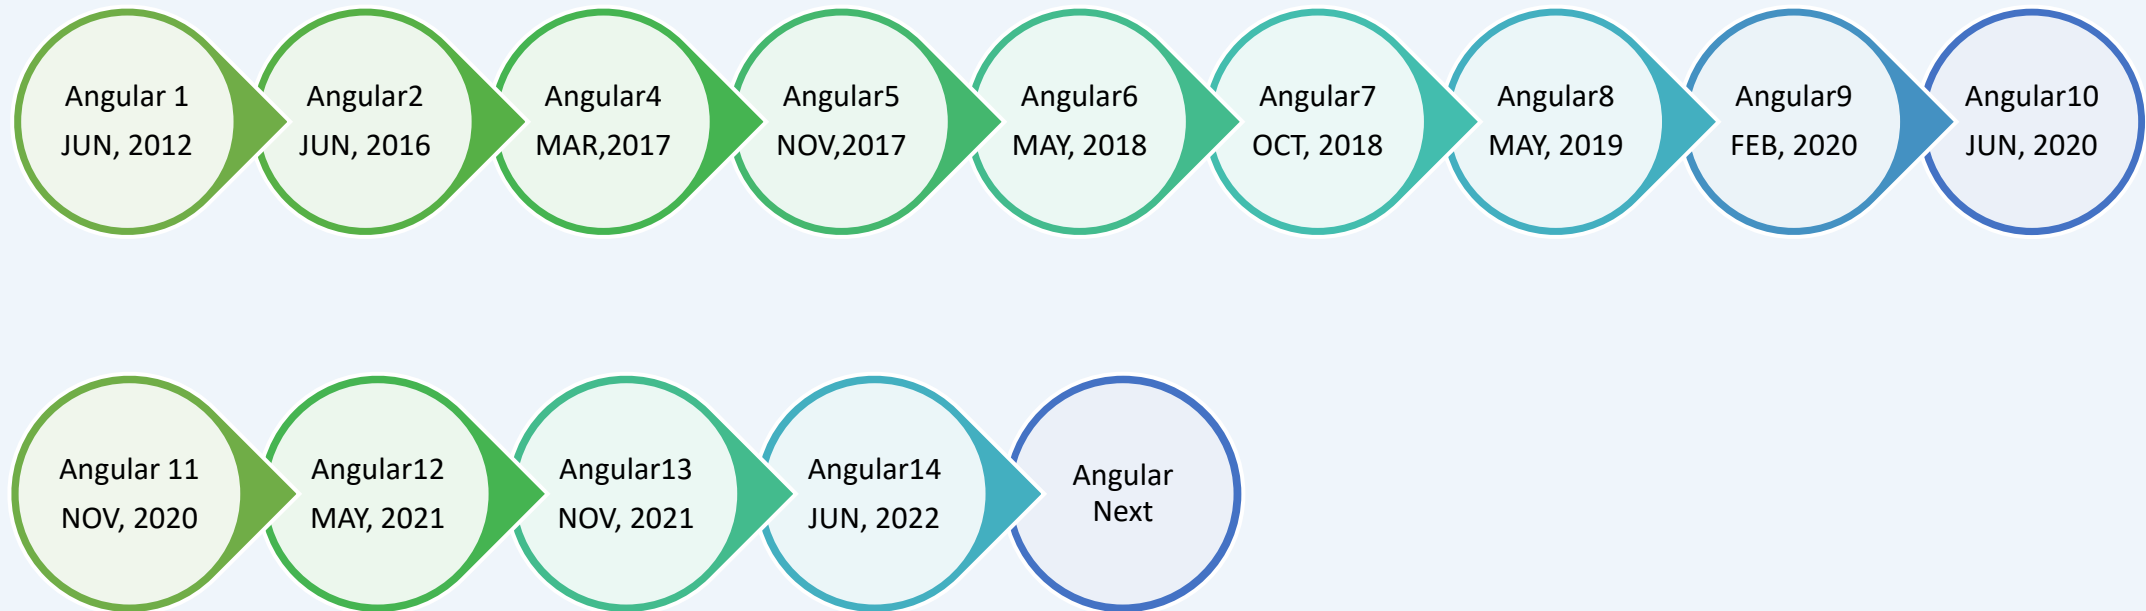

# Q1. What is Angular?

- An open-source framework for building single page applications (SPA) using web technologies like html, css and js.
- Angular is written in TypeScript and follow TypeScript syntax to write code.
- Empowers developers to build applications for browsers, mobiles, or desktop

## Q2. How many versions of Angular have been released?

---

\*Every Six Months Major Release Cycle

## Q3. What is difference between Angular2 and Angular1?

---

### Angular2+

- Based on components
- Improved DI
- Mobile First
- Supports ES5/6, TS or Dart
- Angular CLI
- Class is only way to define services in Angular2
- Runs on client-side & server-side
- `bootstrapModule()` function is used to initialize

### Angular 1.x

- Based on controller and scope
- Supports DI
- Not built with mobile first
- Supports ES5/6 or Dart
- Doesn't have CLI
- `factory`, `service`, `provider`, `value` and `constant` are used for services
- Run on only client-side
- `ng-app` and `angular.bootstrap()` function are used to initialize

# Difference between Angular2 and Angular1 Contd..

---

## Angular2+

- Supports Pipe
- Supports camelCase & PascalCase syntaxes like ngModel, ngForm and NgForm
- Use Html DOM elements properties and events
- Use () for events and [] for attributes

## Angular 1.x

- Support filters
- Supports spinal-case & camelCase syntaxes like ng-model, ng-class and ngModel
- Use it's own directives like ng-click, ng-show and ng-src etc.
- Doesn't support () and [] based syntax

# Q4. How to Set Up Angular Dev Environment?

---

- Download and Install Node.js
- Download and Install IDE - Visual Studio Code or Other TypeScript IDE.
- Download and Install Angular CLI

<https://nodejs.org/en/>

`npm install -g @angular/cli`

<https://www.npmjs.com/>

VS Code

<https://code.visualstudio.com/>

Q&A:

Single Page App (SPA)

# Q1. What is single page application?

---

- Single HTML page is loaded when the app is loaded
- Heavy emphasis on JS & UX (User Experience)
- Consumes data asynchronously from a RESTful API
- Typically, URL doesn't change except for hash (#)
- No page reloads
- Universally accessible through a web browser

## Q2. What are single page application examples?

---

## Q3. What frameworks can be used to build SPA?

---

Angular

React

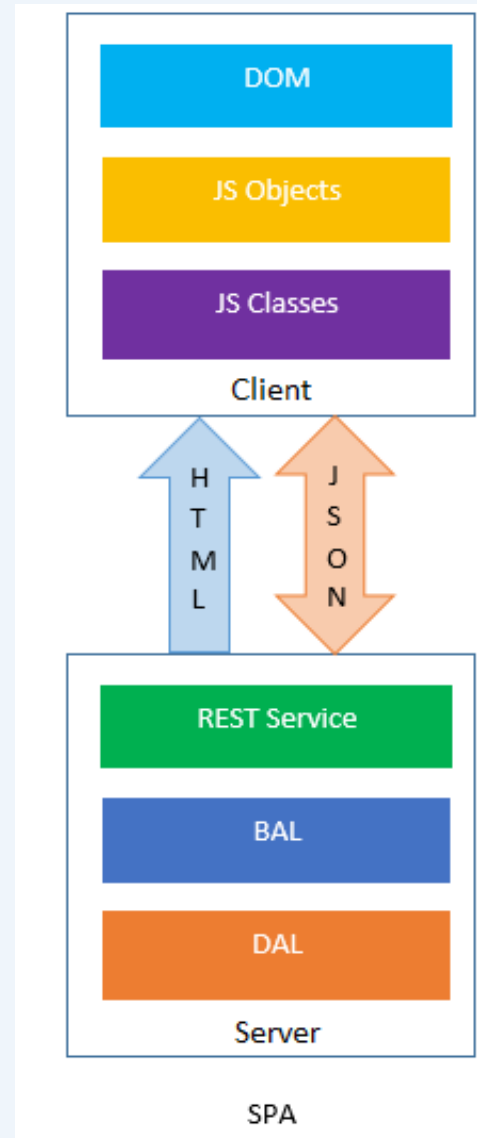

Vue

Meteor

## Q4. How MPA are different from SPA?

Q&A:

Angular CLI

# Q1. What is Angular CLI?

---

- A powerful to create, build, compile and serve Angular2 App
- Used to generate new components, routes, services and pipes
- Installing Angular CLI
  - *npm install -g @angular/cli*
- Generating and serving Angular app
  - *ng new proj\_name --skip-install*
  - *cd proj\_name*
  - *npm install*
  - *ng serve*

## Q2. What are Angular CLI Options?

---

Options	Usage
Help	ng --help
Build	ng build --env
Build and Run	ng serve
Testing	ng test
End-End Testing	ng e2e

## Q3. What are Angular CLI Commands?

Scaffold	Usage	In Short
Module	ng generate module <i>my-module</i>	ng g m <i>my-module</i>
Component	ng generate component <i>my-component</i>	ng g c <i>my-component</i>
Directive	ng generate directive <i>my-directive</i>	ng g d <i>my-directive</i>
Pipe	ng generate pipe <i>my-pipe</i>	ng g p <i>my-pipe</i>
Service	ng generate service <i>my-service</i>	ng g s <i>my-service</i>
Guard	ng generate guard <i>my-guard</i>	ng g g <i>my-guard</i>
Class	ng generate class <i>my-class</i>	ng g cl <i>my-class</i>
Interface	ng generate interface <i>my-interface</i>	ng g i <i>my-interface</i>
Enum	ng generate enum <i>my-enum</i>	ng g e <i>my-enum</i>

## Q4. What are Angular CLI Advantages?

---

- Follow Angular Best Practices
- Configure Style Guides like css, sass
- Use Dev Server Webpack
- Handle Environments
- Build Management
- Testing using Karma and Protractor

Q&A:

# Angular Configuration

# Q1. What is the role of angular.json file?

---

- Contains workspace-wide and project-specific configuration used for build and development used by the Angular CLI.
- Defines the structure of our application and other settings.
- Path values given here are relative to the root workspace folder.

```
"projects": {
  "myapp10am": {
    "projectType": "application",
    "schematics": { ...
  },
  "root": "",
  "sourceRoot": "src",
  "prefix": "app",
  "architect": {
    "build": {
      "builder": "@angular-devkit/build-angular:browser",
      "options": {
        "outputPath": "dist/myapp10am",
        "index": "src/index.html",
        "main": "src/main.ts",
        "polyfills": "src/polyfills.ts",
        "tsConfig": "tsconfig.app.json",
        "assets": [
          "src/favicon.ico",
          "src/assets"
        ],
        "styles": [
          "src/styles.css",
          "node_modules/bootstrap/dist/css/bootstrap.css"
        ]
      }
    }
  }
}
```

## Q2. What is the role of package.json file?

---

- A node package manager(npm) configuration file.
- Includes details about application's package dependencies for development and production.
- **dependencies** option includes necessary packages for production deployment like @angular/core, @bootstrap etc.
- **devDependencies** option includes necessary packages for development purpose like karma, cli.
- **scripts** option includes commands/scripts for packaging our application itself.

```
"scripts": {  
  "ng": "ng",  
  "start": "ng serve",  
  "build": "ng build",  
  "test": "ng test"  
},  
"dependencies": {  
  "@angular/common": "~12.1.0",  
  "@angular/core": "~12.1.0",  
  "@angular/forms": "~12.1.0",  
  "@angular/router": "~12.1.0",  
  "bootstrap": "^5.0.2"  
},  
"devDependencies": {  
  "@angular/cli": "~12.1.0",  
  "@angular/compiler-cli": "~12.1.0",  
  "@types/jasmine": "~3.6.0",
```

## Q3. What is the role of package-lock.json file?

---

- Used to lock dependencies to a specific version number.
- Records the exact version of each installed package which allows you to re-install them.
- While package.json records the minimum version you application needs.

```
"@angular/core": {  
  "version": "12.1.0",  
  "resolved": "https://registry.npmjs.org/  
  "integrity": "sha512-awrC1a6j4U0CU86q8nw  
  "requires": {  
    "tslib": "^2.2.0"  
  }  
},  
"@angular/forms": {  
  "version": "12.1.0",  
  "resolved": "https://registry.npmjs.org/  
  "integrity": "sha512-iWJGvtd7GEisx+pqKDs  
  "requires": {  
    "tslib": "^2.2.0"  
  }  
},  
"@angular/platform-browser": {  
  "version": "12.1.0",  
  "resolved": "https://registry.npmjs.org/  
  "integrity": "sha512-YOUfafuvovy7rfrrUxw
```

## Q4. What is tsconfig.json file?

- A configuration file for typescript compiler.
- Specifies compiler options required to compile the project.

```
tsconfig.json X
1  {
2    "compileOnSave": false,
3    "compilerOptions": {
4      "baseUrl": "./",
5      "module": "esnext",
6      "outDir": "./dist/out-tsc",
7      "sourceMap": true,
8      "declaration": false,
9      "moduleResolution": "node",
10     "emitDecoratorMetadata": true,
11     "experimentalDecorators": true,
12     "target": "es2015",
13     "typeRoots": [
14       "node_modules/@types"
15     ],
16     "lib": [
17       "es2017",
```

## Q5. What is karma.conf.js file?

---

- Angular uses karma framework for testing your application code.
- This file includes partial testing configuration settings for karma.

```
module.exports = function (config) {  
  config.set({  
    basePath: '',  
    frameworks: ['jasmine', '@angular-devkit/build-a  
    plugins: [  
      require('karma-jasmine'),  
      require('karma-chrome-launcher'),  
      require('karma-jasmine-html-reporter'),  
      require('karma-coverage-istanbul-reporter'),  
      require('@angular-devkit/build-angular/plugins  
    ],  
    client: {  
      clearContext: false // Leave Jasmine Spec Runn  
    },  
    coverageIstanbulReporter: {  
      dir: require('path').join(__dirname, '../cover
```

## Q6. What are Polyfills?

---

- Polyfills are scripts that ensure that your application code (which use the new browser features) do not break in the older browsers.
- Polyfills makes our application compatible for different browsers especially IE old versions IE8, IE9 and IE10.
- Polyfills.ts file is used by angular to setup everything for browser compatibility.

## Q7. What is the role of Webpack in Angular?

---

- The Angular build process uses webpack behind the scenes to transpile TypeScript to JavaScript, transform Sass files to CSS, and many other tasks.
- Webpack is an open-source JavaScript-based build tool.
- Used to bundle various assets like JavaScript, CSS, and Images for usage in a browser.
- Webpack takes the dependencies and generates a dependency graph which allows web developers to use a modular approach for development.
- Used from the command line, or can be configured using a config file using `webpack.config.js`.

Q&A:

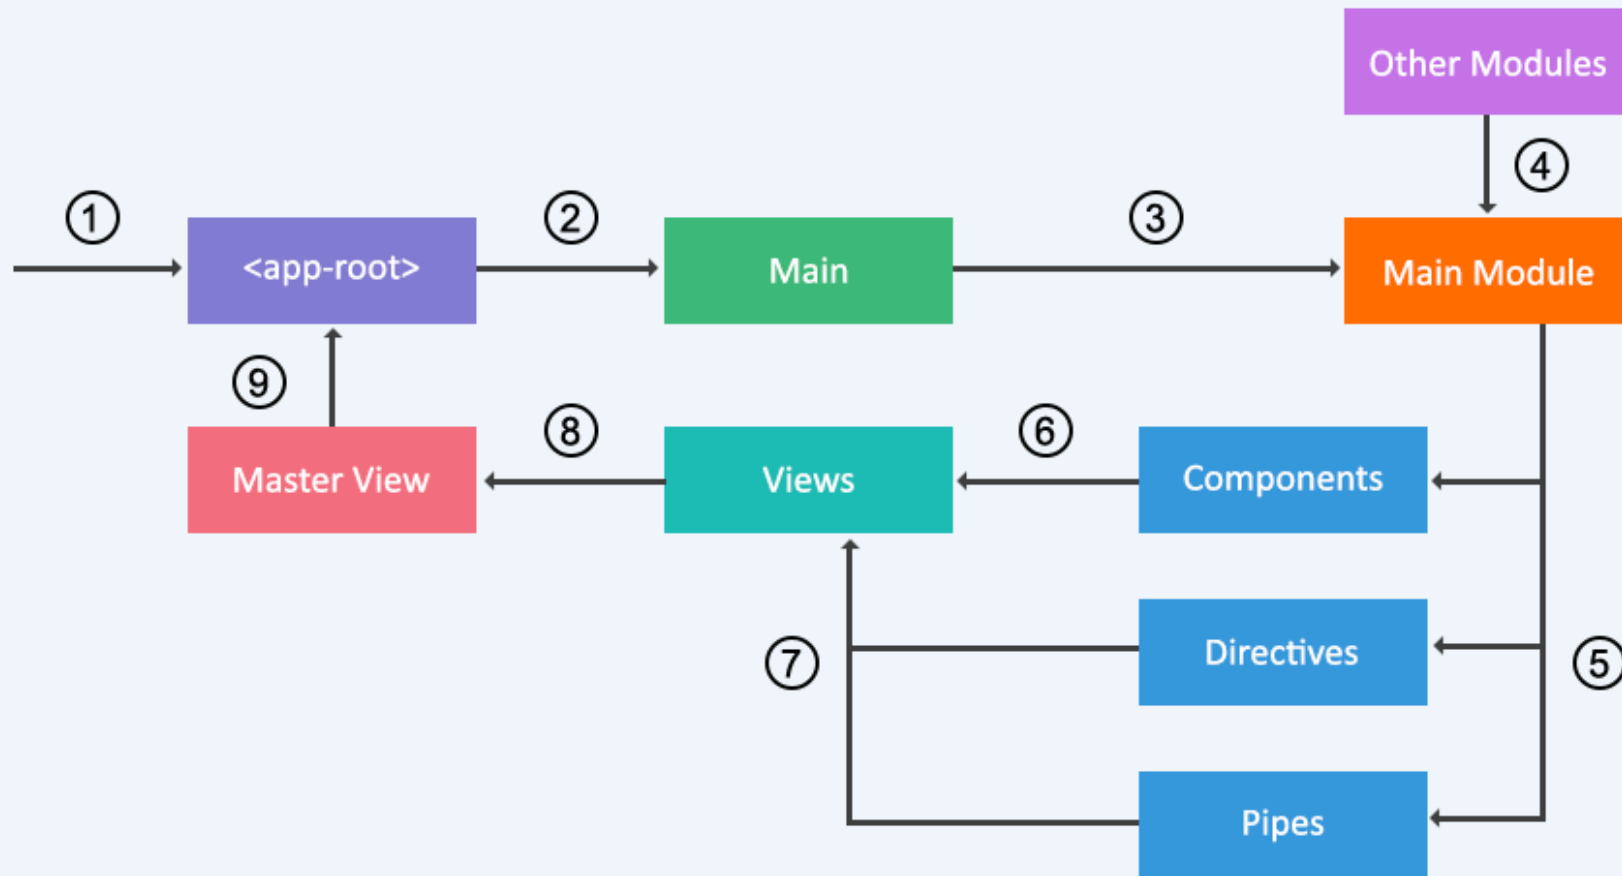

# Angular Building Blocks

# Q1. What are Angular building blocks?

---

- Modules
- Components
- Templates
- Metadata
- Data binding
- Directives
- Pipes
- Routing
- Forms
- Services
- Dependency injection

## Q2. Do explain Angular initialization process?

## Q3. What is Module?

---

- A module organize an application into unified blocks of functionality
- An Angular module is a class with an *@NgModule* decorator
- Accepts a single metadata object whose properties describe the module
- Each Angular app must have at least one module, known as root module

## Q4. What are module main properties?

---

- **imports** – Specify other dependent modules whose classes are required by the component templates declared in the module
- **declarations** – Specify the components, directives, and pipes that belong to the module
- **bootstrap** – Specify the main app view i.e root component. Only the **root module** can have this bootstrap property
- **exports** – A subset of declarations that will be visible and usable in the other modules. A root module doesn't have export option.
- **providers** – Specify the services, accessible across the app

## Q5. What are Built-In Modules?

---

- Angular has built-In library modules starting with the @angular as prefix

@angular/core

@angular/router

@angular/forms

@angular/http

- Built-In library & third part modules can be installed using npm manager
- Built-In modules, components, services, directives etc. can be imported by using built-In library modules

Q&A:

# Components and Decorators

# Q1. What is a Component?

---

- A type of directives with template, styles and logic for user interaction
- Exported as a custom HTML tag like as:
  - `<my-component></my-component>`
- Initialized by Angular Dependency Injection engine

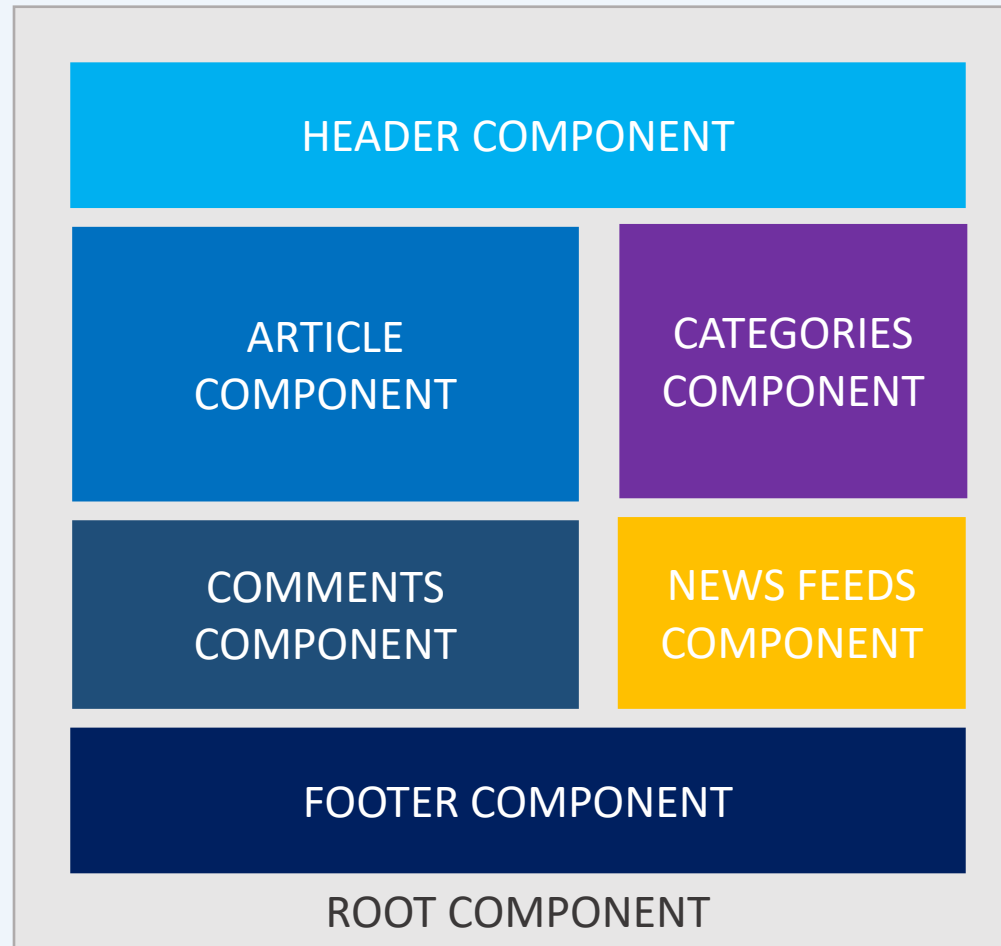

---

- `import { Component } from '@angular/core';`

```
@Component({
  selector: 'my-component',
  template: `<h3>Interpolation</h3>
    <p>Name : {{name}}</p>
    <p><input type="text" value="{{name}}" /></p>`,
  styles: []
})
export class MyComponent {
  name: string = 'Shailendra';
  constructor() { }
}
```

## Q2. How Components can help you to make Webpage?

---

## Q3. What is a Template?

---

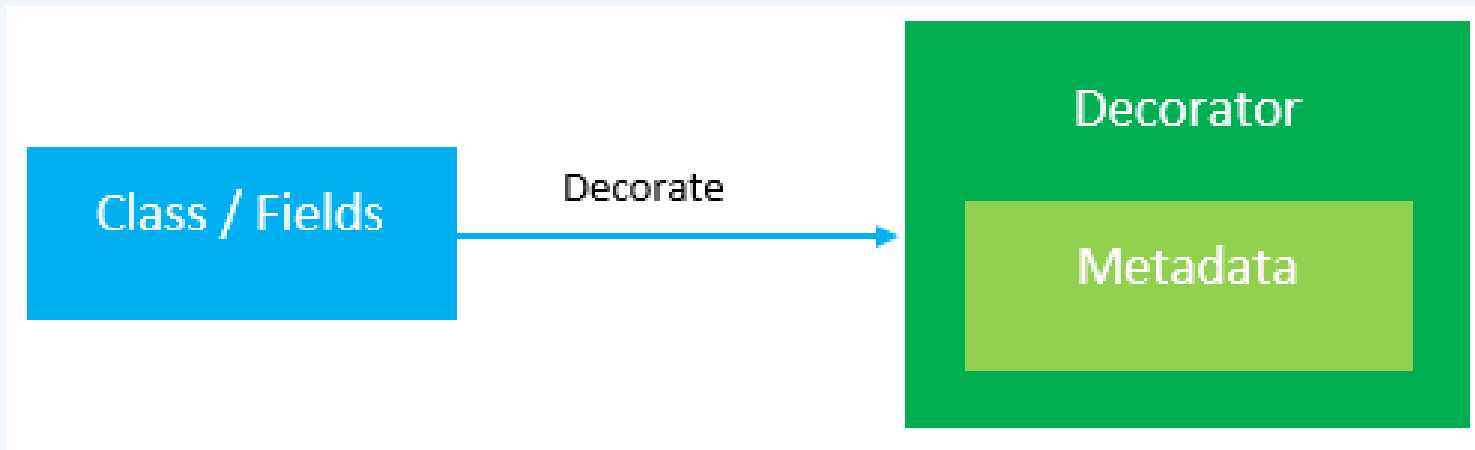

- Define the view of a component
- Contains Html markup and angular directives, attributes etc.
- Describe how a component is rendered on the page

```
<h3>Interpolation</h3>
<p>Name : {{name}}</p>
<p>
  <input type="text" value="{{name}}" />
</p>
```

## Q4. What is a Decorator?

---

- A function that adds metadata to a class, class members
- These are prefix with @ symbol
- Angular has built-In decorators like - @Component, @NgModule, @Directive, @Pipe etc.

# Q5. What are different types of decorators ?

---

- Class decorators
  - @NgModule – Used for defining a module
  - @Component – Used for defining a component
  - @Directive – Used for defining a directive
  - @Injectable – Used for injecting dependencies
  - @Pipe – Used for defining a pipe
- Class field decorators
  - @Input – Used for receiving data (input) from parent to child component
  - @Output – Used for passing data (events) from child to parent component

## Q6. What is Metadata?

- Tells Angular how to process a class
- Decorators are used to attach metadata to a class
