

LINKED LIST DATA STRUCTURE

+

+

+

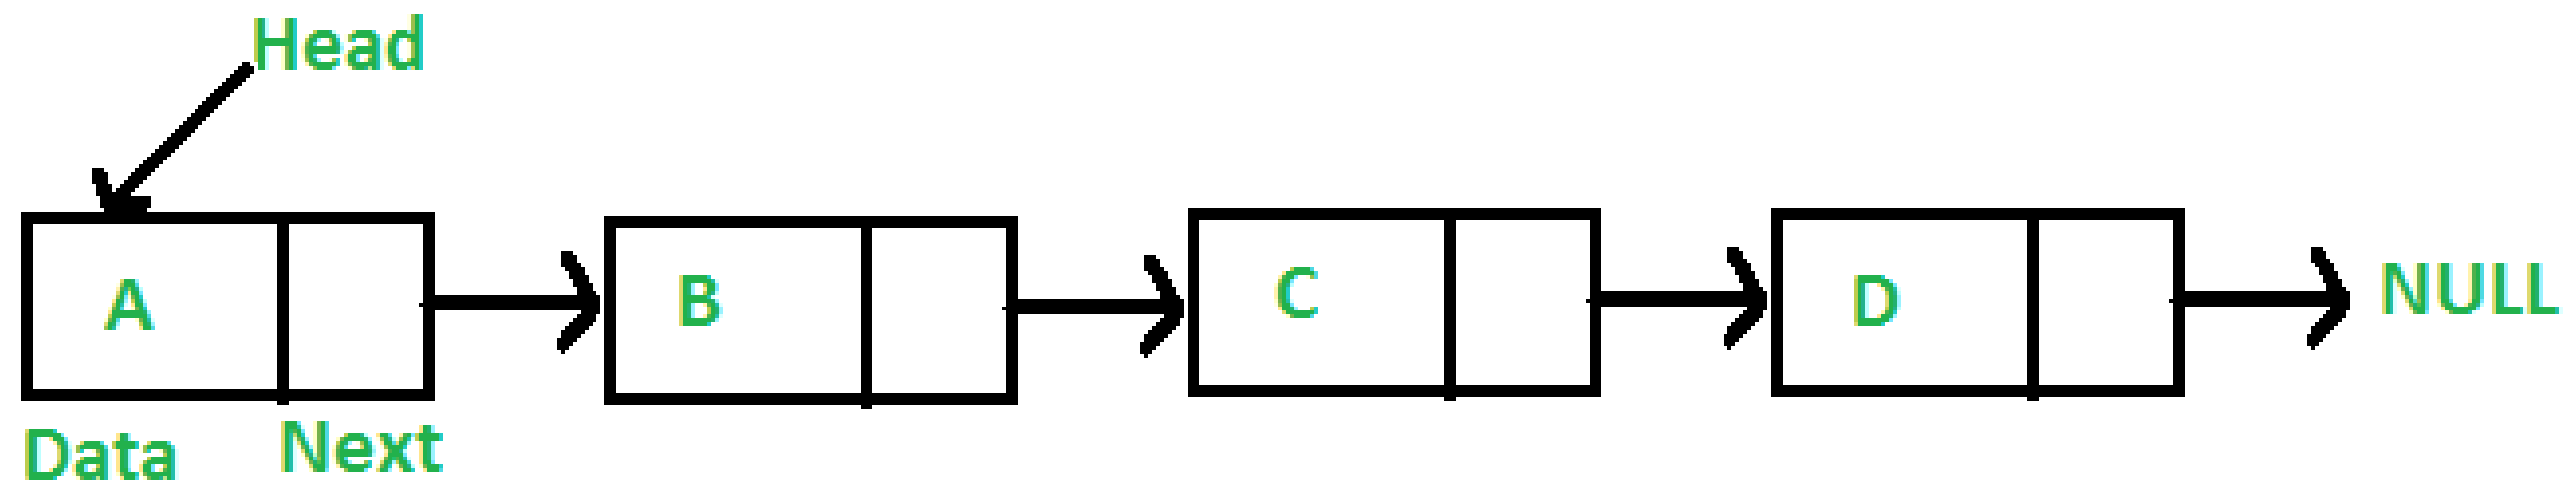

Vaishnavi Waghmale

Definition

A linked list is a linear data structure, in which the elements are not stored at contiguous memory locations.

- Head - First node in Linked List.
- Tail - Last node in the Linked List. ie the node which points to NULL.

...

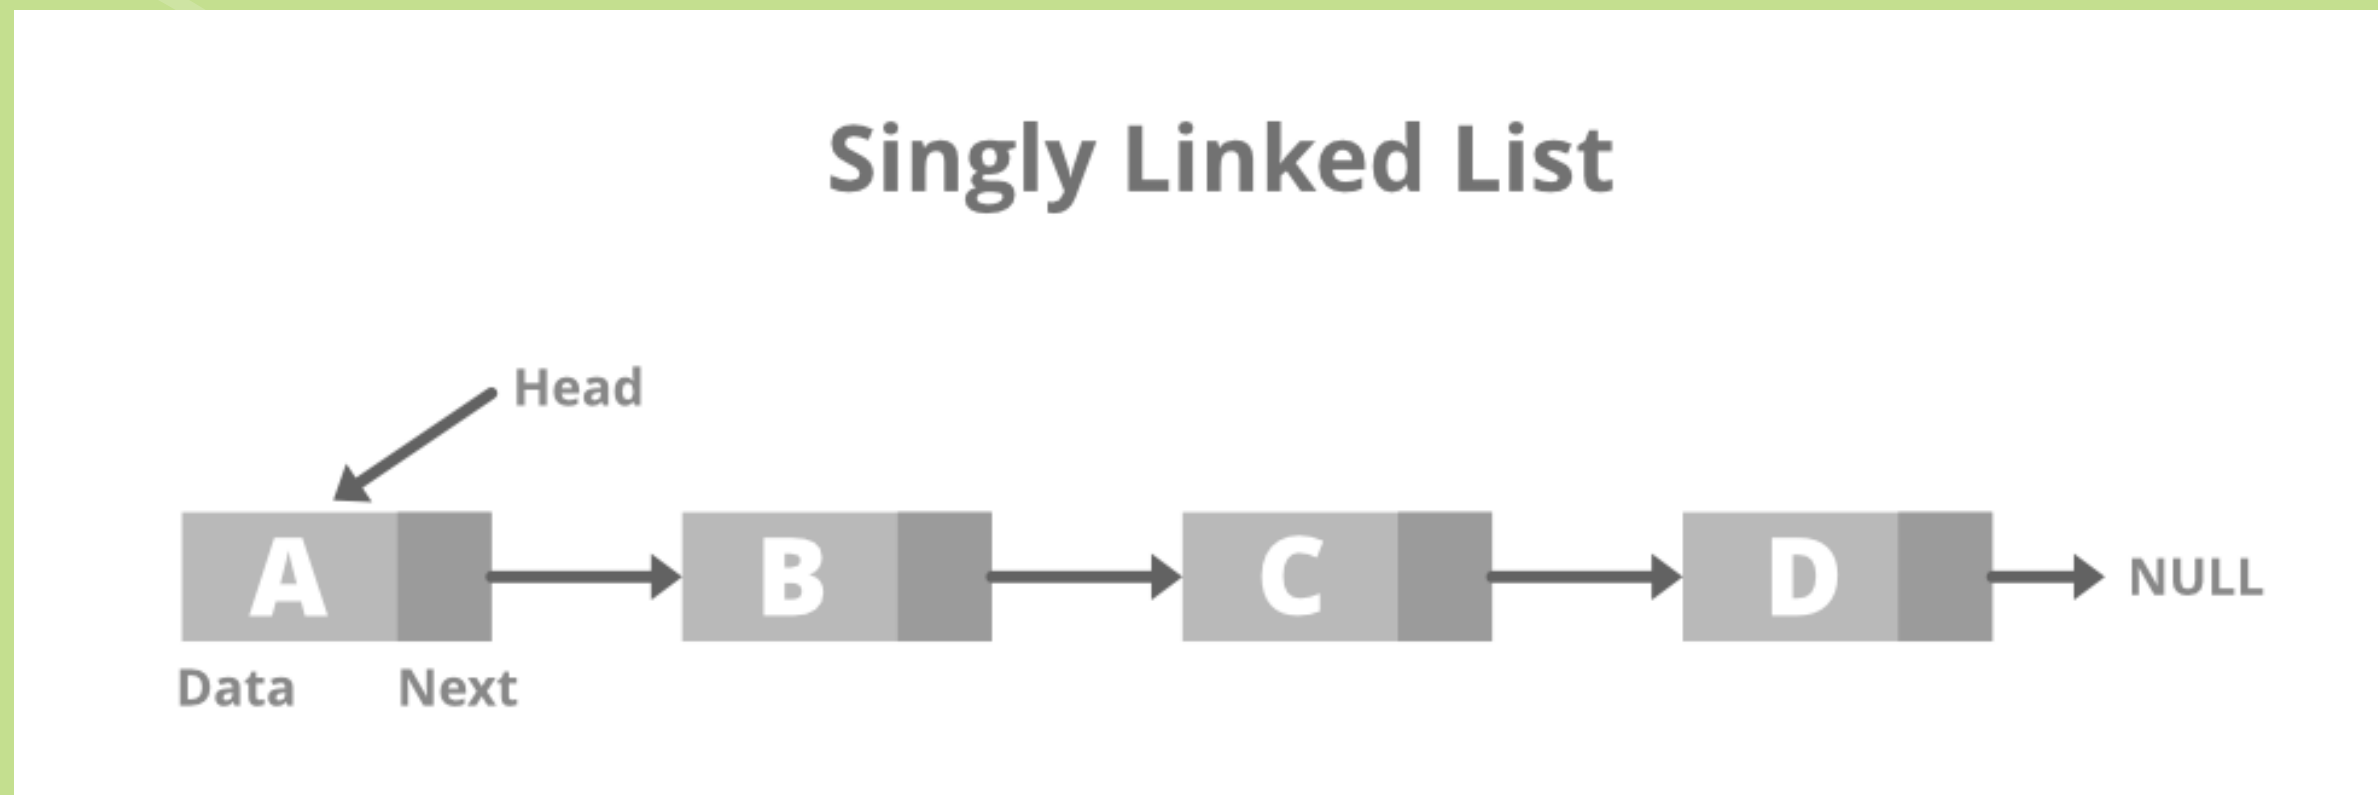

Types of Linked List

- Singly Linked List
- Doubly Linked List
- Circular Linked List
- Circular Doubly Linked List

Singly Linked List

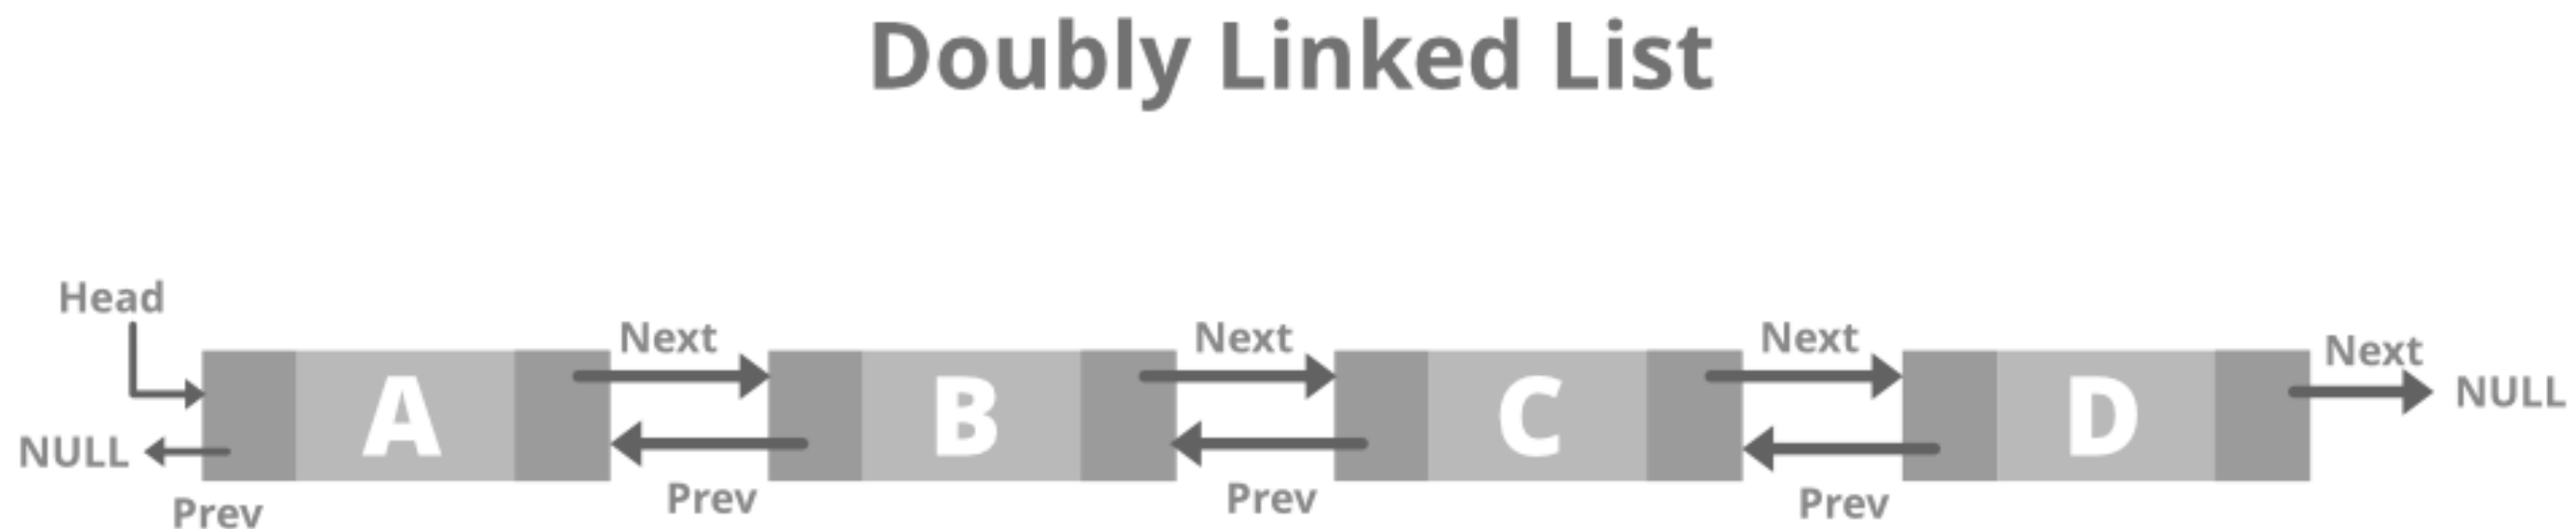

Singly linked list is a unidirectional linked list. The singly-linked list holds data and a link to the next component.

+

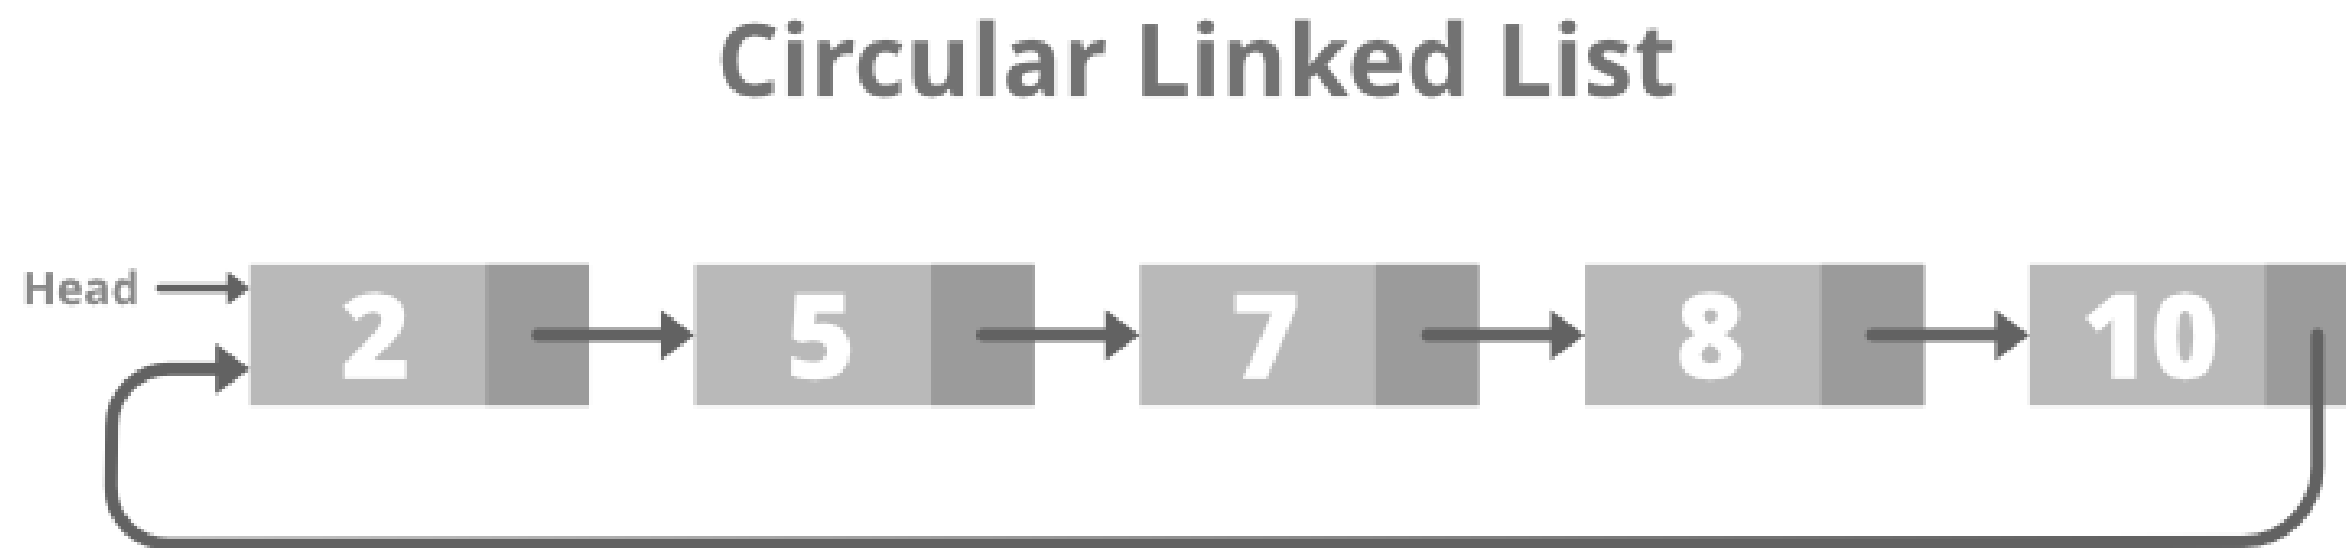

Doubly Linked List

Doubly linked list is a bidirectional linked list. In doubly linked list each node contains a pointer to the previous as well as the next node in the sequence.

Circular Linked List

In a circular linked list, the last node of the list contains a pointer to the first node of the list.

+

Doubly Circular Linked List

Circular doubly linked list is a more complexed type of data structure in which a node contain pointers to its previous node as well as the next node.
